EasyTac downloader enables you to... –

Meet the minimum legal requirements for downloading digital tachograph data. -

EasyTac downloader reads data from drivers' smartcards and stores it in the standard file format required under UK and EU law. You simply need to ensure that you download data from each driver's card once every 3-4 weeks. The software also aids downloading from vehicle unit (VU) download devices. -

View, analyse and print activity reports. -

After the download process, you can use the reporting functions to identify the dates where activity data has been read, and display and/or print the detailed activity data as well as a daily summary of the hours spent on each shift. -

Manage, back-up and forward your stored data. -

Files are automatically stored in a configurable location using a simple-to-understand file naming convention. You can change this location so that it is on either a local disk drive or a network. The files are also freely accessible in case they need to be forwarded by email. A feature to back these files up is also included. -

Print analogue-style tachograph timelines and export your data. -

A printed timeline report includes daily graphical representations for the driver activities. You can also export report data into other programs. -

Re-analyse previous downloads. -

Files previously stored by EasyTac downloader can be re-opened at any time for further analysis and reporting. Standard-format files downloaded by other software applications can also be imported and analysed if required. -

Some typical EasyTac downloader screenshots –

View detailed vehicle unit activity data -

Create daily graphical timelines for drivers and vehicles -

Calculate activity summary tables by shift or day -

Read and store your vehicle unit data -

Simple reminders for when to download driver's cards -

See stored activity data and distances for any dates -
